L2: Entry 64 of 72   File: USPT   Mar 16, 1999

DOCUMENT-IDENTIFIER: US 5884078 A
TITLE: System, method and article of manufacture for creating
an object oriented component having multiple bidirectional
ports for use in association with a java application or applet

DEPR:
Sun's Java language has emerged as an industry-recognized
language, not only for "programming the Internet, but also as "
. . . a serious programming language capable of tackling the
most sophisticated business applications." Sun defines Java as:
"a simple, object-oriented, distributed, interpreted, robust,
secure, architecture-neutral, portable, high-performance,
multithreaded, dynamic, buzzword-compliant, general-purpose
programming language. Java supports programming for the
Internet in the form of platform-independentJava applets." Java
applets are small, specialized applications that comply with
Sun's Java Application Programming Interface (API) allowing
developers to add "interactive content" to Web documents (e.g.
simple animation, page adornments, basic games, etc.). Applets
execute within a Java-compatible browser (e.g. Netscape
Navigator) by copying code from the server to client. From a
language standpoint, Java's core feature set is based on C++.
Sun's Java literature states that Java is basically "C++, with
extensions from Objective C for more dynamic method
resolution".
